Projects

EastEats | **Live App** | **Source** | *TypeScript, Next.js, PostgreSQL, Claude* Oct. 2026 – Present

- Built an East Asian restaurant finder in **Next.js** and **TypeScript**, serving listings before review analysis finishes through **pgmq** jobs that cover up to 120 restaurants per search.
- Kept food quality independent of service and atmosphere by using **Claude** to extract source-linked review evidence and deterministic **TypeScript** to rank it against each user's taste profile.
- Avoided new **Apify** and **Claude** calls when reopening restaurant lists by restoring account-owned search snapshots from **Supabase PostgreSQL**, with fresh collection triggered by new searches or explicit refresh.
