Projects

EastEats | **Live App** | **Source** | *TypeScript, Next.js, PostgreSQL, Claude* Oct. 2026 – Present

- Personalized restaurant discovery across six ranking signals by separating **Claude** review extraction from deterministic **TypeScript** scoring of food, taste, value, distance, service, and atmosphere.
- Eliminated repeat **Apify** and **Claude** calls when reopening restaurant lists by storing account-owned search snapshots in **Supabase PostgreSQL** and restoring the latest list at sign-in.
- Enabled review enrichment for up to 120 restaurants per search in stable batches of 12 by separating discovery from analysis with **pgmq** and **Supabase Edge Functions**, while enforcing database-backed spending limits.
